

Toenail fungus is usually difficult and slow to treat. But now new laser technology is proving to be highly effective. Treatments are fast, non invasive and painless.

New Treatment for Toenail Fungus

Affordable & Effective

- No side effects (unlike oral medications)
- As little as one-time treatment for results
- No after-treatment pain
- Quick: 1-3 minutes per toenail
- Noticeable improvement of nail in 6 weeks

Traditional Treatments

The most common treatments have included:

- Trimming and filing the nail every 6-10 weeks
- Applying topical medications twice a day to twice a week
- Or taking oral medications usually for 45 to 90 days; which can elevate liver enzymes and can cause liver damage, and cannot be used by pregnant women or those planning to get pregnant

Laser Treatment

TWO treatment sessions are advised although success can sometimes be achieved with ONE treatment.

The A.R.C Fox LASER works by heating the nail bed (where the fungus is lodged); this then raises the temperature to about 42°C - 50°C. At this temperature, the cellular metabolism, cell structure, cell enzymes and proteins of the fungus are destroyed thus, killing the fungus and clearing the nail.

The A.R.C Fox Laser is the best alternative to taking oral medications.

FAQ

Improvement time? On average, a toenail will replace itself every 9 to 12 months. Healthy new growth will typically be visible between 6 weeks.

Recovery time? No, walk in and walk out.

Procedure time: 1-3 minutes per toenail, 30 minutes for all 10 toenails

Can the nail infection return? Because fungus is present everywhere in the environment, reinfection can recur, so it is important to practice proper foot care after treatment.

How do you find out more?
